

## NAME

xzless, lzless – view xz or lzma compressed (text) files

## SYNOPSIS

**xzless** [*file...*]

**lzless** [*file...*]

## DESCRIPTION

**xzless** is a filter that displays pagefulls of uncompressed text from compressed file(s) to a terminal. It works on files compressed with **xz**(1) or **lzma**(1). If no *files* are given, **xzless** reads from standard input.

**xzless** uses **less**(1) as its only pager. Unlike **xzmore**, the choice of pagers is not alterable by an environment variable. Commands are based on both **more**(1) and **vi**(1), and allow back and forth movement and searching. See the **less**(1) manual for more information.

The command named **lzless** is provided for backward compatibility with LZMA Utils.

## ENVIRONMENT

### LESSMETACHARS

A list of characters special to the shell. Set by **xzless** unless it is already set in the environment.

### LESSOPEN

Set to a command line to invoke the **xz**(1) decompressor for preprocessing the input files to **less**(1).

## SEE ALSO
